History of Engineering and Development of Industrial Engineering

Asst. Prof. Dr. Mustafa Alp ERTEM
Department of Industrial Engineering
Çankaya University
30.09.2014
Eğitim geçmişi

**University of Arkansas** – Fayetteville, AR  
Ph.D., Industrial Engineering  
- Dissertation title: “Procurement Auctions-Based Framework with Announcement Options For Resources Allocation in Disaster Relief Operations”  
- Advisor: Dr. Nebil Buyurgan (Ph.D., UMR), University of Arkansas

**Middle East Technical University** – Ankara, Turkey  
Master of Science, Industrial Engineering  
- Advisor: Dr. Canan Sepil (Ph.D., UFL), Middle East Technical University  
- Co-Advisor: Dr. Thomas Lacksonen (Ph.D., PSU), University of Wisconsin-Stout

**Istanbul Technical University** – Istanbul, Turkey  
Bachelor of Science, Industrial Engineering  
- Senior thesis title, “Quality Management Systems and Implementations in Catering”  
- Industrial Engineering project, “HACCP and Quality Management Systems”  
- Advisor: Dr. Ufuk Cebeci (Ph.D., ITU), Istanbul Technical University
Çalışma geçmişi

- Danışmanlık firması - 6 ay
- Türk Telekom - ~ 2 yıl
- Amerika’da asistanlık – 3 yıl
- Amerika’da lojistik firması – 2,5 yıl
- Çankaya Endüstri Müh. Böl. ’de 01.03.2011 tarihi itibariye işe başladım. - ~ 3,5 yıl

Science and Engineering – Early Developments

• How did the two words industrial and engineering become combined to form the label industrial engineering?
  
  • relationship of industrial engineering to other engineering disciplines

• To understand the role of industrial engineering (IE) in today’s complex world, it is helpful to learn the historical developments involved in the progress of IE.
  
  • Science is concerned with the search for basic knowledge
  
  • Engineering is concerned with the application of scientific knowledge.

• Engineering and science have been developed in a parallel, complementary fashion, although not always at the same pace.
Science and Engineering – Early Developments

• Engineering provides feedback to science in areas where new knowledge is needed.

• In earlier times, although science and engineering each have different characteristics / are different disciplines, they are the same person
  • Leonardo di ser Piero da Vinci (April 15, 1452 – May 2, 1519) was an Italian scientist, mathematician, engineer, inventor, anatomist, painter, sculptor, architect, botanist, musician, writer

• The person who discovered the knowledge also put into use
  • The Pyramids
  • the Great Wall of China
  • The Roman Construction Projects

• Efforts to provide a better life
Science and Engineering – Early Developments

- Almost all engineering developments prior to 1800 had to do with physical phenomena
  - Overcoming friction
  - Lifting
  - Construction

- Later developments were concerned with chemical and molecular phenomena
  - Electricity
  - Properties of materials
  - Thermal processes
  - Combustion
  - Other chemical processes
Science and Engineering – Early Developments

- Fundamental to almost all engineering developments were the advances made in mathematics.

- Another very important contribution of mathematics was the ability to represent reality in abstract terms.
  - Pythagorean theorem

- The use of abstract models representing complex physical systems is a fundamental tool of engineers.
Science and Engineering – Modern Era

• Beginning in 1750s
  • Engineering schools appeared in France in the eighteenth century.
  • The term civil engineering was first used in 1750.

• Principles of early engineering were first taught in military academics with road and bridge construction.
  • Military engineering

• Same principals were applied to nonmilitary endeavors
  • Civil engineering
Science and Engineering – Modern Era

- Interrelated advancements in the fields of physics and mathematics laid the groundwork for practical applications of mechanical principles.

- An important advancement was the development of a practical steam engine.
  - These efforts resulted in the emergence of mechanical engineering.

- Latter part of the eighteenth century, fundamental work is conducted on electricity and magnetism and static electric
  - Samuel Morse, development of telegraph (1840s)
  - Thomas Edison, invention of carbon-filament lamp

- Generation, transmission and utilization of electrical energy
  - Electrical engineering
Science and Engineering – Modern Era

- Developments in mechanical and electrical engineering initiate the developments in the understanding of substances and their properties.
  - Fuels, Lubricants, protective coatings, dyes, synthetic materials
  - Chemical engineering
- As industrial organizations profit from technological developments, the size and the complexity of manufacturing units increased dramatically.
  - Mass production
    - Interchangibility of parts
    - Specialization of labor
Science and Engineering – Modern Era

• Within half a century the developing countries changed from largely rural, agricultural economies and societies to urban, industrialized economies and societies (from 1850 to 1900).

• The management practices that had worked well for small shops and farms simply were inadequate for large, complex manufacturing organizations.

• The need for better management systems led to the development of what is now called industrial engineering.

• Five major engineering disciplines (civil, mechanical, electrical, chemical, and industrial) were the branches of engineering that came out prior to the World War I.
  • Part of the industrial revolution

• Developments following World War II led to other engineering disciplines, such as nuclear engineering, electronic engineering, aeronautical engineering, computer engineering
The Engineering Process

• Engineers *solve problems*, but so do mathematicians.

• Engineers *analyze*, but so do statisticians and economists.

• Engineers *design systems*. Do others?

• Architects design buildings,

• But they rely on engineers for much of their work.

• The distinguishing characteristic of engineering is that it is concerned with the design of systems.

• Design involves a considerable amount of creativity.

• Kind of an art that one learns through experience.
System

- A **system** may be defined as a set of components which are related by some form of interaction, and which act together to achieve some objective or purpose.

- **Components** are simply the individual parts, or elements, that collectively make up a system.

- **Relationships** are the cause-effect dependencies between components.

- **Objective or purpose** of a system is the desired state or outcome which the system is attempting to achieve.

- Air-conditioning system.

- Components of this system include the heat pump, the thermostat, the air within the system and the electricity that drives the system (even the house (walls, ceiling, floors, furniture, etc.) itself is a component).
The Engineering Process

- **Analysis** is concerned with resolving something into its basic elements.
  - Concerned with existing systems

- **Synthesis** is concerned with combining elements into a whole.
  - Concerned with a new or improved system
  - Synthesis is a term whose meaning is almost the same as design (in engineering)

- The engineering process, which is used by all engineers, involves both synthesis and analysis as shown in the next slide.
The Engineering Process

- The iterative process is repeated until an accepted solution, system, or method is derived (acceptable=optimal)
Engineering as a Profession

• Professions
  • medicine, teaching, architecture, law, ministry and engineering

• Associated with a profession is a significant body of special knowledge.

• Preparation for a profession includes an internship-like training period following the formal education.

• Code of ethics:
  • Each member of a profession recognizes his responsibilities to society over his clients or other members of the profession.

• The need for continuous learning and public service are the other features of engineering.
Chronology of Industrial Engineering

• Although there is considerable commonality among the different branches of engineering, each branch has distinguishing characteristics that are important to recognize.

• Industrial engineering emerged as a profession as a result of the industrial revolution and the accompanying need for technically trained people who could plan, organize, and direct the operations of large complex systems.

• The need to increase efficiency and effectiveness of operations was also an original stimulus for the emergence of IE.
Chronology of Industrial Engineering

• Charles Babbage (1791–1871) visited factories in England and the United States in the early 1800’s and began a systematic recording of the details involved in many factory operations.

  • He carefully measured the cost of performing each operation as well as the time per operation required to manufacture a pound of pins.

  • Money could be saved by using women and children to perform the lower-skilled operations. The higher-skilled, higher-paid men need only perform those operations requiring the higher skill levels.

  • Division of labor: right person for the right job
Chronology of Industrial Engineering

• **Interchangable parts manufacture** is to produce parts so accurately that a specific part of a particular unit of a product could be interchanged with the same part from another unit of the product.

  • **Eli Whitney** (1765 –1825) received a government contract to manufacture muskets using this method.

  • Laborers having only a minimal amount of training.

  • Whitney created the first mass production system.
Chronology of Industrial Engineering

• Frederick W. Taylor (1856 - 1915) recognizes potential improvements to be gained through analyzing the work content (minimum amount of work required to accomplish the task) of a job and designing the job for maximum efficiency.

• Three phase method of improving efficiency:
  • Analyze and improve the method of performing work
  • Reduce the times required
  • Set standards for what the times should be.
Chronology of Industrial Engineering

• Frank B. Gilbreth (1868 - 1924) extended Taylor’s work considerably.

• Gilbreth’s primary contribution was the
  • identification
  • analysis
  • measurement

of fundamental motions involved in performing work.

• Gilbreth was able to measure the average time to perform each basic motion.

• This permitted, for the first time, jobs to be designed and the time required to perform the jobs known before the fact (art to science)

• Lillian Gilbreth (1878 –1972) – the first industrial psychologist
Chronology of Industrial Engineering

• Henry L. Gantt (1861 –1919), developed the Gantt chart.

• The Gantt is a systematic graphical procedure for pre-planning and scheduling work activities, reviewing progress, and updating the schedule.

• During the 1920s and 1930s much of fundamental work was done on
  • economic aspects of managerial decisions,
  • inventory problems,
  • incentive plans,
  • factory layout problems,
  • material handling problems,
  • principles of organization.
Chronology of Industrial Engineering

- Idea of scientific management (systematic work study) became very successful.

- It has increased the productivity, while reducing physical efforts and hours of work of labours, and increased the productivity by a factor of one hundred.

- The period from 1900 through the mid-1930s is generally referred as scientific management.

- Industrial engineering begins in the late 1920s and extends to the present time.

- Operations research had a great influence on IE practice starting in the mid-1940s and extend past mid-1970s.

- The fourth period known as industrial engineering and system engineering, is shown beginning around 1970 and extend indefinitely into the future.
Chronology of Industrial Engineering

Chronology of significant events and developments in the evolution of "INDUSTRIAL & SYSTEMS ENGINEERING"

Macro View

Scientific Management

- Efficiency experts
- Wage incentive plans
- Interchangeable parts
- Accounting

- Division & specification of labor
- Motion study
- Piecework
- Schedule charts

- Standardization
- Organization concept

- Mass production
- Time studies

- Labor unions
- Management controls
- Organization models

- Productivity
- Engineering economy
- Statistical quality control

- Operations analysis
- Inventory theory
- Network techniques

- Operations Research
- Decision theory
- Simulation

- Resource Mgmt.
- Systems design
- CAD/CAM

- Digital computer
- Math programs
- Numeric control

- Teleprocessing
- Time sharing
- PC

- Computers
- Automated inspection

- Machine vision
- Voice Prog.

- Control Theory
- Large Scale Sys.
- Total Sys. Design
- Social Sys.
- Cybernetics

- Behavioral Th.

- Heirarchical control
- Distributed data processing
- Flexible automation

- Computer networks

Definition of Industrial Engineering

- Formal definition of Industrial Engineering adopted by the Institute of Industrial Engineers (IIE):

- IE is concerned with the design, improvement, and installation of integrated systems of people, materials, information, equipment and energy. It draws upon specialized knowledge and skill in the mathematical, physical, and social sciences together with the principles and methods of engineering analysis and design to specify, predict, and evaluate the results to be obtained from such system.

- The term implies industrial and systems engineering

- The term industrial is often associated with manufacturing organizations, here it is intended to apply to any organization.

- The basic principles of IE are being applied widely in agriculture, hospitals, banks, government organizations, and so forth.
Industrial Engineering Education

• Industrial Engineering subjects were initially taught as special courses in mechanical engineering departments (option in ME).

• The first separate department of industrial engineering was established in 1908 (Pennsylvania State University, the USA).

• But it was only after the World War II, separate IE departments became widely spread.

• In Turkey in 1969
  • ITU
  • METU

• Our department have started the BS programme in 1998. So you are the 16th freshman students.
Impact of Related Developments – Impact of Operations Research

• The development of industrial engineering has been greatly influenced by the impact of an analysis approach called operations research.

• This approach originated in England and the United States during World War II and was aimed at solving difficult war-related problems through the use of science, mathematics, behavioral science, probability theory, and statistics.

• Following World War II, OR were extended to problems in industry and commerce.

• This resulted in considerable number of mathematicians and scientists who contributed to OR (and also IE).
Impact of Related Developments – Impact of Operations Research

- Some IE departments have changed their names to IEOR
  - University of California, Berkeley
  - Colombia University
  - Cornell University

- A specific problem was identified. Specialists from appropriate fields formed an interdisciplinary task force to develop a solution. One person cannot have expertise in all the scientific areas.

- Currently, OR represents a set of quantitative methods that are applicable to a wide range of managerial and operational problems.

- Many industrial engineers do consider operations research as being their primary interest.
Impact of Related Developments – Impact of Digital Computers

• Another development that had a significant impact on the IE profession is the digital computer.

• Digital computers permit the rapid and accurate handling of huge quantities of data, so permitting the IE to design systems for effectively managing and controlling large, complex operations.

• The digital computer also permits the IE to construct computer SIMULATION models of manufacturing facilities in order to evaluate the effectiveness of alternative facility configurations.

• Computer-aided design (CAD) and computer-aided manufacturing (CAM).

• Generate process plans, bills of material, tool release orders, work schedules, operator instructions (ERP)
Impact of Related Developments – Impact of Digital Computers

- IEs are good at computers, since they use PCs extensively to
  - perform various analyses,
  - execute mathematical models
  - plan and manage complex projects
  - create data bases,
  - implement a wide range of decision support tools.
Impact of Related Developments – Service Industries

• In the early days of the industrial engineering profession, IE practice was applied almost fully in manufacturing organizations.

• After World War II there was a growing awareness that the principles and techniques of IE were also applicable in non-manufacturing environments.

• Health-care industry

  • improve their operations, eliminate waste, control inventories, schedule activities

• Government agencies

  • Thousands of Industrial Engineers are employed by government organizations to increase efficiency, reduce paperwork, design computerized management control systems, implement project management techniques, monitor the quality and reliability of vendor-supplied purchases, and for many other functions.
Relationship with other Engineering Disciplines

Relationship of “INDUSTRIAL & SYSTEMS ENGINEERING” to other Engineering and scientific disciplines

- Logic
- Mathematics
- Physics
- Military Engineering
- Chemical Engineering
- Civil Engineering
- Electrical Engineering
- Mechanical Engineering
- Early Industrial Engineering (Called Scientific Management)

Branches:
- Statistics
- Quality & Reliability
- Operations Research & Systems Sciences
- Computer & Information Science
- Control Theory
- Psychology & Sociology
- Productivity Science
- Early Management Philosophy
- Manufacturing Engineering
- Ergonomics
- Physiology
- Economics
Challenges of the Future

- Major challenges
  
  - Learn to accomplish the engineer’s mission in recognition of constraints on natural resources
  
  - Design systems and processes that are compatible with our natural environment.
  
  - Design and production of safe and reliable products.
Diversity of IE

• Industrial engineering is a diverse (various) discipline concerned with the design, improvement, installation, and management of integrated systems of people, materials, and equipment for all kinds of manufacturing and service operations.

• Industrial engineering is concerned with performance measures and standards, research of new products and product applications, ways to improve use of scarce (limited) resources and many other problem solving adventures.

• An Industrial Engineer may be employed in almost any type of industry, business or institution, from retail establishments to manufacturing plants to government offices to hospitals.

• Because their skills can be used in almost any type of organization, and also industrial engineers are usually distributed among industries than other engineers.
Diversity of IE

• Industrial engineers work in insurance companies, banks, hospitals, retail organizations, airlines, government agencies, consulting firms, transportation, construction, public utilities, social service, electronics, personnel, sales, facilities design, manufacturing, processing, and warehousing.
Duties of IE

• Industrial engineers determine the most effective ways for an organization to use the basic factors of production - people, machines, materials, and energy. They are more concerned with people and methods of business organization than engineers in other specialties.

• To solve organizational, production, and related problems most efficiently, industrial engineers design data processing systems and apply mathematical analysis such as operations research.

• They also develop management control systems to help in financial planning and cost analysis, design production planning and control systems to coordinate activities and control product quality, and design or improve systems for the physical distribution of goods and services.

• Industrial engineers conduct surveys to find plant locations with the best combination of raw materials, and transportation.

• They also develop wage and salary administration systems and job evaluation programs.
Duties of IE

• Install data processing, management information, wage incentive systems.

• Develop performance standards, job evaluation, and wage and salary programs.

• Research new products and product applications.

• Improve productivity through application of technology and human factors.

• Select operating processes and methods to do a task with proper tools and equipment.

• Design facilities, management systems, operating procedures.
Duties of IE

- Improve planning and allocation of limited resources
- Enhance plant environment and quality of people's working life
- Evaluate reliability and quality performance
- Implement office systems, procedures, and policies
- Analyze complex business problems by operations research
- Conduct organization studies, plant location surveys, and system effectiveness studies
- Study potential markets for goods and services, raw material sources, labor supply, energy resources, financing, and taxes.
Duties of IE

• So we can have a lot to do 😊

• But we have a lot to learn 😞
